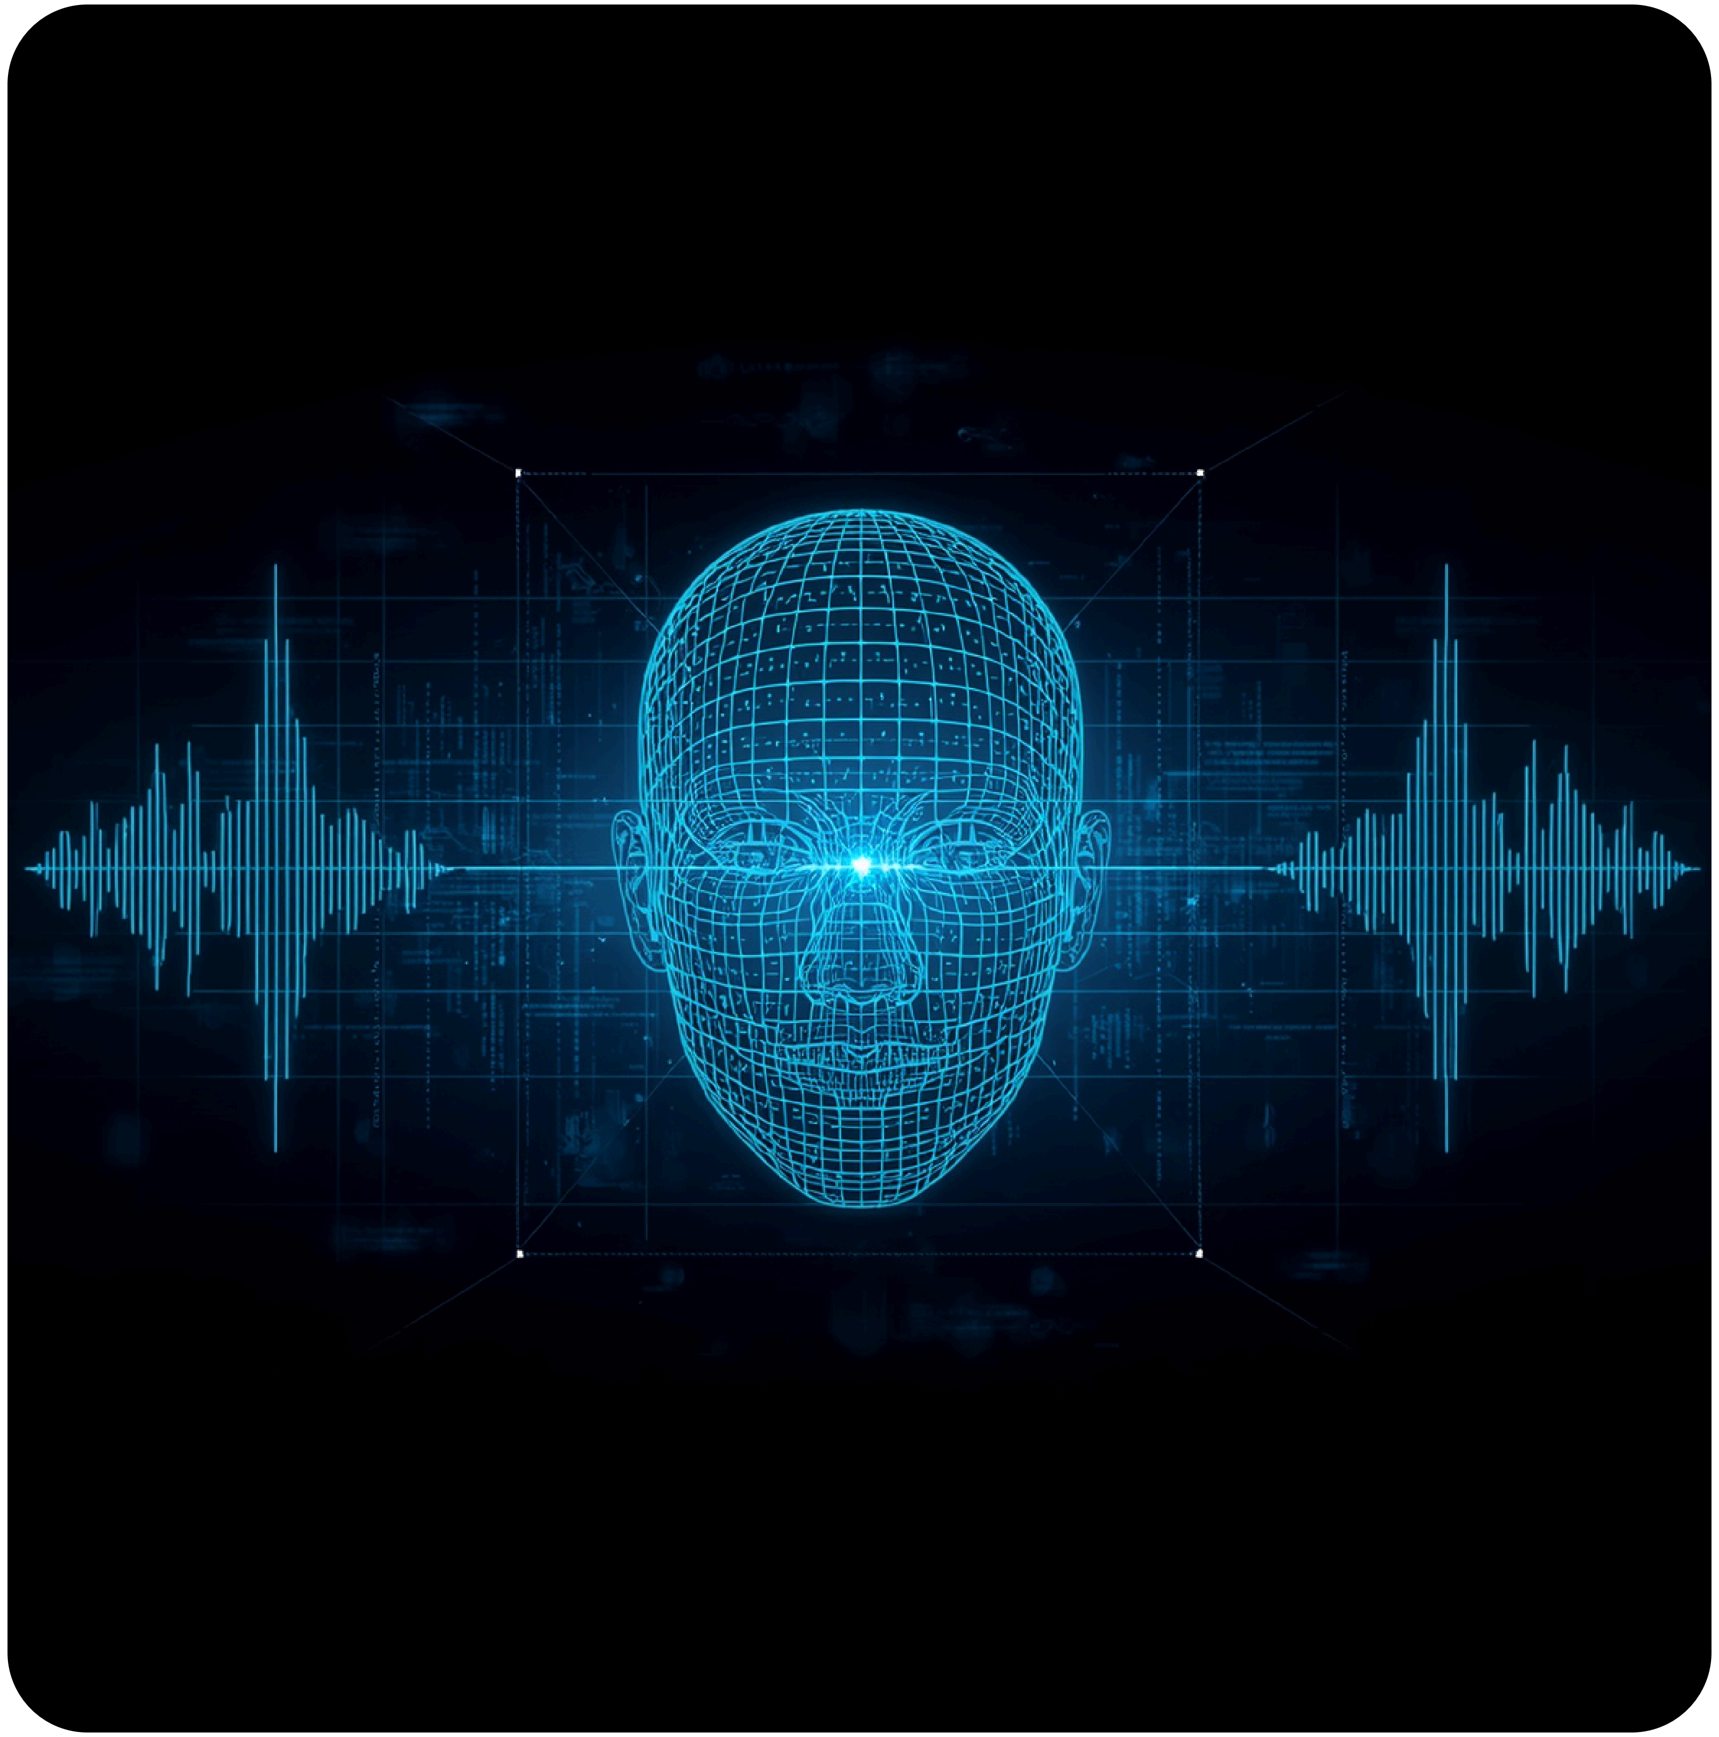
AI Detection System

MULTIMODAL EMOTION & DISTRACTION DETECTION

Real-time AI system using facial expressions and voice analysis

Prepared by: Datha Sai, Reshmi



PROBLEM STATEMENT

1. No real-time emotion and attention detection
2. No automatic engagement measurement
3. Low productivity and reduced engagement
4. Poor learning outcomes

WHY THIS MATTERS

Growing Remote Work: Online learning is expanding

No Personalized Feedback: Emotional state not considered

Signals Missed: Important cues go unnoticed

Performance Impact: Productivity suffers greatly

EXISTING LIMITATIONS

1. Single Data Type Only
2. Facial Recognition OR Voice Analysis
3. Lower Accuracy & Reliability
4. No Multimodal Integration
5. Distraction Goes Undetected

Current System Gaps

Existing solutions rely on single-modal approaches, using either facial recognition or voice analysis alone, resulting in reduced accuracy and inability to detect distraction effectively.

PROPOSED SOLUTION

1. Webcam captures facial expressions
2. Microphone captures voice signals
3. AI processes both modalities
4. Detects emotions & distraction levels

Multimodal Emotion &
Distraction Detection System

THANK YOU

Questions & Discussion
